

Combined v individual support measured by LR with $y=0.7$

LR

one versus many

- item of evidence a, $LR=x/(1-x)$
- item of evidence b, $LR=y/(1-y)$
- two items combined $Pr(A)=0.1, Pr(B)=0.2$
- two items combined $Pr(A)=0.1, Pr(B)=0.4$
- two items combined $Pr(A)=0.3, Pr(B)=0.4$
